MyGate securely connects its teams with **Android Enterprise**

MyGate® / android

MyGate is a fast-growing company in India that aims to simplify the living experience in gated communities. Residents in over 20,000 communities across India use the MyGate mobile app to grant visitors entry, pay their leases, and get health and safety notices directly from management.

"Android Enterprise is one of our keys to keeping our employees connected no matter where their day takes them. Our IT team uses the secure, helpful controls to provide the right level of access whilst ensuring everyone has the apps they need with security that protects our critical data."

Ravi Mohan
General Manager, MyGate

The company began with a focus on security management for residential communities, and has since become a central hub for updating residents about health and safety, and providing a marketplace for in-home services from third parties – with more features on the way. MyGate is currently used in over 3.5 million residences throughout India, and continues to scale operations to bring these benefits to even more communities.

Android Enterprise is key to keeping the company's employees connected no matter where their day takes them, thanks to strong security and effortless management.

Finding the right balance with work profile

The MyGate IT team uses Google endpoint management to enroll and manage its corporate-owned Android devices with the work profile. Hybrid teams access Google Workspace from more than 2,000 devices, with a dedicated space for work apps in their profile.

Many of the MyGate teams prefer to complete quick tasks like answering comments in a doc, replying to a thread in Gmail or updating a sheet directly from their Android devices.

The sales teams are especially often on the go – regularly meeting with potential customers, checking in with current clients, and working from the office or at home. MyGate uses managed Google Play to enroll everyone's device with the MyGate app, which teams use to demonstrate for prospective customers how the company's service simplifies life in a gated housing community and gives residents a welcome and positive living experience.

> General Manager, MyGate

MyGate employees are big fans of how the Android work profile separates company and personal apps on their device.

The work profile gives the IT team the ideal combination of security for company data and privacy for employees. IT allowlists specific apps that are essential to employees' daily work, so they can be securely accessed in the work profile. Managing updates and installing new apps through managed Google Play helps keep everyone up to date with the tools they need. And employees are ensured privacy on the personal side of their device with the ability to disconnect when they wish by pausing their work profile.

Keeping the connection

Android Enterprise also complements MyGate's <u>Chrome OS device deployment</u>. Through Chrome Enterprise upgrade management capabilities, MyGate has been able to quickly give employees devices that are simple to enroll and ready to use. Google Meet has also been essential for team meetings and quick syncs, and has helped in securely scaling contact center team operations.

MyGate continues to scale in offering safety and convenience for housing community residents, right from their mobile device. By managing its company-owned smartphones with Android Enterprise, MyGate can focus on its growth with confidence that it has the strong data and device protection with management controls for its mobile security needs.

"By managing our company-owned smartphones with Android Enterprise, we have confidence in being able to scale up quickly and take advantage of the strong data and device protection with the controls that are right for our critical security needs."
